# How to Install 997 Insert Wings – Decklid Disassembly

1 Raise the electric wing and remove the 4 plastic caps to the left and right of the third brake light. Using a 25w Torx socket loosen (don't try to remove) the four bolts and lift the grill up and out.

2 The 4 bolts only pinch these plastic tabs. They do not go all the way through.

3 Remove the two 6mm bolts holding the under tray to the top of each piston.

4 Remove the two 6 mm hex head bolts holding each hinge to the front of the steel decklid

5 The undergrill tray is now able to be removed.

6 Remove the circlip holding the pivot pin and remove the nut plate from the top of each plastic piston. For installation of Getty Design's Aero Cab, GT2 Insert for 997 or Pedestal Wing, no further disassembly of the decklid is needed. The pistons continue to function inside of the insert.
